Schedule a visit today to discuss which flea and tick preventative is best for all of your pets.

It's a quick and easy way to prevent serious problems.

**FLEA & TICK
SEASON IS HERE**

Why is flea and tick prevention important for your pet and family?

Flea and tick prevention is an important part of taking good care of your cat or dog. Not only are fleas and ticks uncomfortable for a pet, they can also transmit a variety of serious diseases to your pets and you.

Where and when can my pet get fleas & ticks? Dogs and cats can get fleas and ticks in a variety of places — whether they go outside or not. Other animals (or even humans) can bring fleas and ticks into your home. And anytime your pet is outside, they are at risk. Wildlife such as squirrels, rabbits and raccoons all carry fleas and ticks. Fleas and ticks can live outside year-round but the worst months are spring and fall.

How and when should I prevent fleas & ticks? Because fleas and ticks can be found outside all year long, it is important that your pet is always protected. If you see signs of fleas or ticks on your pet, start treatment immediately. We offer a series of medically-approved, easy-to use products that are guaranteed to protect your pet.

Flea & Tick Prevention Products

- Topical spot-on treatments (applied between the shoulder blades)
- Oral medications
- Collars

Diseases carried by fleas & ticks

Flea Allergy Dermatitis

This is an allergic reaction caused by substances in flea saliva and (at times) by tick bites. Itchy, inflamed skin and papules develop and the irritation may cause hair loss and infection.

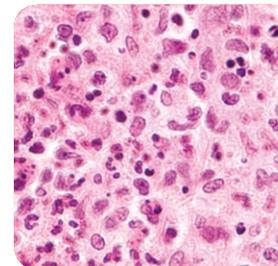

Lyme Disease

The most common tick-borne disease in the United States, Lyme Disease causes a sudden onset of lameness that can be accompanied by fever, anorexia and lethargy. Lyme vaccinations, in conjunction with flea and tick preventatives, are recommended for all dogs.

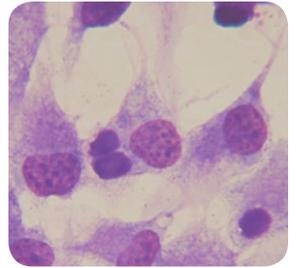

Bartonella

These are parasites transmitted through flea or tick bites that can infect humans, dogs, cats and rodents. Bartonella invades red blood cells and multiplies. It can cause multiple ailments and is responsible for Cat-Scratch Disease in humans.

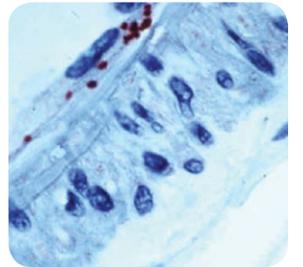

Ehrlichia

This is a bacterial infection transmitted through tick bites that works to destroy white blood cells. Infection results in lethargy, weight loss, anemia and enlarged lymph nodes and spleen.

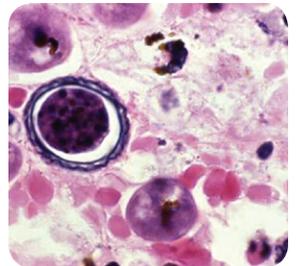

Rickettsia

This is a bacteria that can be transmitted by flea or tick bites. Infection can lead to typhus, Rocky Mountain spotted fever, flea-borne spotted fever and tick bite fever.

Meningoencephalitis

This is a deadly, inflammatory disease that can be caused by tick-borne viruses. It infects the brain and spinal cord and can lead to loss of nervous system function. Fever, pain, convulsions and paralysis are symptoms of infection.

Tapeworms

Tapeworms are parasitic flatworms that can be transmitted by fleas that are ingested during grooming.

Flea and tick protection can help prevent serious problems for your pet. Come in to speak with one of our veterinarians to see what product is best for your pet.
